
Inputs and initialization
Current conditions or 24 h / 240 h history
Canopy and environment LAI, vegetation, light, temperature, soil, gases, wind
Biogenic options species, vertical mode, response and loss switches
Species activity
Temperature + light activity sunlit and shaded leaves
Species and vegetation parameters emission factor + response coefficients
Environmental responses CO2, leaf age, soil moisture, air quality and weather stress
Potential emission emission factor x activity
Vertical treatment
biovert_opt
1-3
1-3 | Canopy-integrated flux plant, Gaussian, or equal weights with eligible canopy loss
0
0 | Layer-resolved profile weighted by leaf area
Model output
Integrated flux in top layer kg m-2 s-1
Layer-resolved emissions kg m-3 s-1
Model emissions
Point-list text output 1D input; all species selected canopy_write_txt
Gridded NetCDF output 2D input; NETCDF build
